Weather and climate patterns are a driving force behind the success or failure of cropping systems. With U.S. corn and soybean production accounting for nearly one-third of global supplies and contributing over $50 billion annually to the national economy, the ability to successfully produce crops under more variable climate conditions becomes critical for food security and rural livelihoods.

The U2U project strives to enhance the usability and take-up of climate information and bolster Extension capacity to address agro-climate concerns. We are developing climate-based tools to assist Corn Belt farmers and ag advisors with decisions related to purchasing, marketing and activity planning throughout the growing cycle. Long term, we expect these efforts will lead to more profitable agricultural systems and greater resilience to a changing climate.

**Top 5 Project Accomplishments (2011-2014)**

1. Simulated the impacts of historical and future climate conditions on crop productivity across the U.S. Corn Belt using crop models of varying biophysical complexity and process scale representations.

2. Conducted three large-scale surveys of Corn Belt farmers and ag advisors about climate information needs, climate change beliefs and concerns, and trusted information sources.

3. Worked closely with stakeholders to develop two web-based agro-climate decision support tools in 2013. Two additional products will be released in 2014.

4. Presented project information at 90+ conferences and events, and published 40+ book chapters, journal articles, and Extension publications featuring U2U research.

5. Received an additional $565K in funding among team members to expand and leverage U2U research, tools, and ideas.

**Project Collaborators**

An integrated team of university researchers, climatologists and social scientists from across the Corn Belt collaborate on the U2U project.

- **Purdue University**
  Linda Stalker Prokopy* (lead), Larry Biehl, Stuart Carlton, Otto Doering*, Sajeev E.M., Ben Gramig*, Elin Karlsson, Olivia Kellner, Anil Kumar, Xing Liu, Dev Niyogi*, Paul Preckel, Carol Song*, Shanxia Sun, Melissa Widhalm, Lan Zhao

- **University of Illinois**
  Jim Angel*, Beth Hall*, Steve Hilberg, Atul Jain*, Yang Song

- **University of Michigan**
  Yun-Jia Lo, Maria Carmen Lemos*

- **University of Missouri**
  Pat Guinan*, Ray Massey*

- **University of Nebraska-Lincoln**
  Juliana Dai, Roger Elmore*, Tonya Haigh, Cody Knutson*, Tapan Pathak, Martha Shulski*

- **University of Wisconsin**
  Jenna Klink, Erika Kluetmeier, Rebecca Power*

AgClimate View
A convenient way to access customized historical climate and crop yield data for the U.S. Corn Belt. View and download graphs of monthly temperature and precipitation, plot corn and soybean yield trends, and compare climate and yields over the past 30 years. AgClimate View also provides insights on rainfall and temperature variability throughout the year and lets you compare current conditions to the historical average.

Corn GDD
Track real-time and historical corn growing degree day accumulations, assess spring and fall frost risk, and guide decisions related to planting, harvest and seed selection. This innovative tool integrates corn development stages with weather and climate data for location-specific decision support, tailored specifically to agricultural production.

Climate Patterns Viewer
Discover how global climate patterns like the El Niño Southern Oscillation (ENSO) and Arctic Oscillation (AO) have historically affected local climate conditions across the U.S. Corn Belt. Climate Patterns Viewer provides simple maps and charts to determine when (by month) and where (by climate division) specific phases of ENSO or AO have influenced temperatures, precipitation and crop yields.

COMING SOON
Corn Split N
This product can be used to determine the feasibility and profitability of using in-season nitrogen application for corn production. The Corn Split N tool combines historical data on crop growth and fieldwork conditions with economic considerations to determine best/worst/most likely scenarios of successfully completing nitrogen applications within a user-specified time period.

COMING IN 2015
Irrigation Investment
This tool will use present-day conditions and future climate projections to offer guidance on irrigation investment decisions. This tool can be used to determine the potential costs and pay-off periods of irrigation by region.

Crop and Climate Model Dashboard
The dashboard will offer a simple, unique look at expected changes in key agronomic variables between current day and 2040. This will allow the ag community to quantify risk due to potential changes in crop yields, days suitable for fieldwork, soil moisture, ET and more.
